TO WHOM IT MAY CONCERN

I am glad to write in support of Onake Faith Imomoh. I run the Ubuntu Bridge Initiative Cybersecurity Internship and read Onake's work myself, so this is not a form letter.

We opened Cohort 1 to 2,828 applicants and took a small fraction. Imomoh came through that, then through five core stages, and earned a place in our Advanced Programme in SOC Analysis, a room that by then held 18 people.

Nothing here is awarded for attendance: every claim must trace back to a raw artefact the candidate produced, and findings are defended out loud while a reviewer hunts for the weak point.

COMPLETED AND ASSESSED — 9 PROJECTS

- Stage 0 — Foundations
- Stage 1 — Applied Cryptography
- Stage 2 — Web Application Security
- Stage 3 — Incident Response
- Stage 4 — Governance & Risk
- Advanced Stage 5 — Signal
“Build a Production Hunt Engine”
- Advanced Stage 6 — Exposure
“Engineer a Deception Sensor and Analysis Pipeline”
- Advanced Stage 7 — Architecture
“Build a Network Detection Range as Code”
- Advanced Stage 8 — Adversity
“Detection Engineering Under Adversary Pressure”

The furthest project Imomoh submitted for assessment was Advanced Stage 9 — The Final Case, on the SOC Analysis brief “Full Incident Response”. The submitted evidence was reviewed against the brief's full scope: Resolved a sealed multi-source DFIR case, building a parser-driven super-timeline with explicit source clocks and provenance, reconstructing a multi-host intrusion from phishing through persistence and lateral movement to exfiltration, recovering and hashing the exfiltrated dataset, and shipping tested detection and recovery code.

ASSESSED CAPABILITIES

- Verified acquisition & parser-driven timeline
- Multi-host intrusion chain reconstructed
- Exfiltrated dataset recovered and hashed
- Tampered evidence caught by manifest check
- Sigma, YARA & Zeek content under fixtures
- Containment and recovery automation

Working toolkit: Python · DuckDB · T-Pot · containerlab · Zeek/Suricata · Wazuh · Volatility 3

What I would say to any employer is this. Imomoh took the hardest route available through a programme built around detection engineering and incident reconstruction, and the work held up under someone whose job was to find its faults. People who can do that are not common, and they tend to be worth more than their years suggest. I recommend Onake without reservation, and I am glad to answer any question about this reference.

Yours sincerely,

Okoma Somto
